

HEIDENHAIN

Rotary Encoders

November 2011

Rotary encoders from HEIDENHAIN

serve as measuring sensors for rotary motion, angular velocity and, when used in conjunction with mechanical measuring standards such as lead screws, for linear motion. Application areas include electrical motors, machine tools, printing machines, woodworking machines, textile machines, robots and handling devices, as well as various types of measuring, testing, and inspection devices.

The high quality of the sinusoidal incremental signals permits high interpolation factors for digital speed control.

Rotary encoders for separate shaft coupling

Electronic handwheel

Rotary encoders with mounted stator coupling

This catalog supersedes all previous editions, which thereby become invalid. The basis for ordering from HEIDENHAIN is always the catalog edition valid when the contract is made.

Standards (ISO, EN, etc.) apply only where explicitly stated in the catalog.

Measuring Principles

Measuring Standard

HEIDENHAIN encoders with **optical scanning** incorporate measuring standards of periodic structures known as graduations. These graduations are applied to a carrier substrate of glass or steel.

These precision graduations are manufactured in various photolithographic processes. Graduations are fabricated from:

- extremely hard chromium lines on glass,
- matte-etched lines on gold-plated steel tape, or
- three-dimensional structures on glass or steel substrates.

The photolithographic manufacturing processes developed by HEIDENHAIN produce grating periods of typically 50 µm to 4 µm.

These processes permit very fine grating periods and are characterized by a high definition and homogeneity of the line edges. Together with the photoelectric scanning method, this high edge definition is a precondition for the high quality of the output signals.

The master graduations are manufactured by HEIDENHAIN on custom-built high-precision ruling machines.

Encoders using the **inductive scanning principle** have graduation structures of copper/nickel. The graduation is applied to a carrier material for printed circuits.

Measuring Methods

With the **absolute measuring method**, the position value is available from the encoder immediately upon switch-on and can be called at any time by the subsequent electronics. There is no need to move the axes to find the reference position. The absolute position information is read from the **grating on the graduated disk**, which is designed as a serial code structure or—as on the ECN 100—consists of several parallel graduation tracks.

A separate incremental track (on the ECN 100 the track with the finest grating period) is interpolated for the position value and at the same time is used to generate an optional incremental signal.

In **singleturn encoders**, the absolute position information repeats itself with every revolution. **Multiturn encoders** can also distinguish between revolutions.

Circular graduations of absolute rotary encoders

With the **incremental measuring method**, the graduation consists of a periodic grating structure. The position information is obtained **by counting** the individual increments (measuring steps) from some point of origin. Since an absolute reference is required to ascertain positions, the graduated disks are provided with an additional track that bears a **reference mark**.

The absolute position established by the reference mark is gated with exactly one measuring step.

The reference mark must therefore be scanned to establish an absolute reference or to find the last selected datum.

Circular graduations of incremental rotary encoders

Scanning Methods

Photoelectric scanning

Most HEIDENHAIN encoders operate using the principle of photoelectric scanning. Photoelectric scanning of a measuring standard is contact-free, and as such, free of wear. This method detects even very fine lines, no more than a few microns wide, and generates output signals with very small signal periods.

The ECN, EQN, ERN and ROC, ROQ, ROD rotary encoders use the imaging scanning principle.

Put simply, the imaging scanning principle functions by means of projected-light signal generation: two graduations with equal grating periods are moved relative to each other—the scale and the scanning reticle. The carrier material of the scanning reticle is transparent. The graduation on the measuring standard can likewise be applied to a transparent surface, but also a reflective surface.

When parallel light passes through a grating, light and dark surfaces are projected at a certain distance. An index grating with the same grating period is located here. When the two gratings move relative to each other, the incident light is modulated. If the gaps in the gratings are aligned, light passes through. If the lines of one grating coincide with the gaps of the other, no light passes through. Photovoltaic cells convert these variations in light intensity into nearly sinusoidal electrical signals. Practical mounting tolerances for encoders with the imaging scanning principle are achieved with grating periods of 10 µm and larger.

The ROC/ROQ 400/1000 and ECN/EQN 400/1000 absolute rotary encoders with optimized scanning have a single large photosensor instead of a group of individual photoelements. Its structures have the same width as that of the measuring standard. This makes it possible to do without the scanning reticle with matching structure.

Other scanning principles

ECI/EQI and RIC/RIQ rotary encoders operate according to the inductive measuring principle. Here, graduation structures modulate a high-frequency signal in its amplitude and phase. The position value is always formed by sampling the signals of all receiver coils distributed evenly around the circumference.

The accuracy of position measurement with rotary encoders is mainly determined by

- the directional deviation of the radial grating,
- the eccentricity of the graduated disk to the bearing,
- the radial deviation of the bearing,
- the error resulting from the connection with a shaft coupling (on rotary encoders with stator coupling this error lies within the system accuracy),
- the interpolation error during signal processing in the integrated or external interpolation and digitizing electronics.

For **incremental rotary encoders** with line counts up to 5000:

The maximum directional deviation at 20 °C ambient temperature and slow speed (scanning frequency between 1 kHz and 2 kHz) lies within

$$\pm \frac{18^\circ \text{ mech.} \cdot 3600}{\text{Line count } z} \text{ [angular seconds]}$$

which equals

$$\pm \frac{1}{20} \text{ grating period.}$$

The ROD rotary encoders generate 6000 to 10000 signal periods per revolution through signal doubling. The line count is important for the system accuracy.

The accuracy of absolute position values from **absolute rotary encoders** is given in the specifications for each model.

For absolute rotary encoders with **complementary incremental signals**, the accuracy depends on the line count:

Line count	Accuracy
16	± 480 angular seconds
32	± 280 angular seconds
512	± 60 angular seconds
2048	± 20 angular seconds

The above accuracy data refer to incremental measuring signals at an ambient temperature of 20 °C and at slow speed.

Photoelectric scanning according to the imaging scanning principle

Mechanical Design Types and Mounting

Rotary Encoders with Stator Coupling

ECN/EQN/ERN rotary encoders have integrated bearings and a mounted stator coupling. They compensate radial runout and alignment errors without significantly reducing the accuracy. The encoder shaft is directly connected with the shaft to be measured. During angular acceleration of the shaft, the stator coupling must absorb only that torque caused by friction in the bearing. The stator coupling permits axial motion of the measured shaft:

ECN/EQN/ERN 400: $\pm 1 \text{ mm}$

ECN/EQN/ERN 1000: $\pm 0.5 \text{ mm}$

ECN/ERN 100: $\pm 1.5 \text{ mm}$

Mounting

The rotary encoder is slid by its hollow shaft onto the measured shaft, and the rotor is fastened by two screws or three eccentric clamps. For rotary encoders with hollow through shaft, the rotor can also be fastened at the end opposite to the flange. Rotary encoders of the ECN/EQN/ERN 1300 series with taper shaft are particularly well suited for repeated mounting (see the brochure *Position Encoders for Servo Drives*). The stator is connected without a centering collar on a flat surface. The **universal stator coupling** of the ECN/EQN/ERN 400 permits versatile mounting, e.g. by its thread provided for fastening it from outside to the motor cover.

Dynamic applications require the highest possible natural frequencies f_N of the system (also see *General Mechanical Information*). This is attained by connecting the shafts on the flange side and fastening the coupling by four cap screws or, on the ECN/EQN/ERN 1000, with special washers.

Natural frequency f_E with coupling fastened by 4 screws

	Stator coupling	Cable	Flange socket	
			Axial	Radial
ECN/EQN/ERN 400	Standard Universal	1 550 Hz 1 400 Hz ¹⁾	1 500 Hz 1 400 Hz	1 000 Hz 900 Hz
ECN/ERN 100		1 000 Hz	–	400 Hz
ECN/EQN/ERN 1000		1 500 Hz ²⁾	–	–

¹⁾ Also when fastening with 2 screws

²⁾ Also when fastening with 2 screws and washers

For ECN/EQN/ERN 1000

For increasing the natural frequency f_E and mounting with only two screws.

ID 334 653-01

Shaft clamp ring

for ECN/EQN/ERN 400

By using a second shaft clamp ring, the mechanically permissible speed of rotary encoders with hollow through shaft can be increased to a maximum of 12000 min^{-1} .

ID 540 741-xx

If the encoder shaft is subject to high loads, for example from friction wheels, pulleys, or sprockets, HEIDENHAIN recommends mounting the ECN/EQN/ERN 400 with a bearing assembly.

Bearing assembly

For ERN/ECN/EQN 400 series with blind hollow shaft

ID 574 185-03

	Bearing assembly
Permissible speed n	$\leq 6000 \text{ min}^{-1}$
Shaft load	Axial: 150 N; Radial: 350 N
Operating temperature	-40 to 100 °C

The bearing assembly is capable of absorbing large radial shaft loads. It prevents overload of the encoder bearing. On the encoder side, the bearing assembly has a stub shaft with 12 mm diameter and is well suited for the ERN/ECN/EQN 400 encoders with blind hollow shaft. Also, the threaded holes for fastening the stator coupling are already provided. The flange of the bearing assembly has the same dimensions as the clamping flange of the ROD 420/430 series. The bearing assembly can be fastened through the threaded holes on its face or with the aid of the mounting flange or the mounting bracket (see page 15).

Torque supports for the ERN/ECN/EQN 400

For simple applications with the ERN/ECN/EQN 400, the stator coupling can be replaced by torque supports. The following kits are available:

Wire torque support

The stator coupling is replaced by a flat metal ring to which the provided wire is fastened.

ID 510955-01

Pin torque support

Instead of a stator coupling, a "synchro flange" is fastened to the encoder. A pin serving as torque support is mounted either axially or radially on the flange. As an alternative, the pin can be pressed in on the customer's surface, and a guide can be inserted in the encoder flange for the pin.

Rotary Encoders for Separate Shaft Coupling

ROC/ROQ/ROD and **RIC/RIQ** rotary encoders have integrated bearings and a solid shaft. The encoder shaft is connected with the measured shaft through a separate rotor coupling. The coupling compensates axial motion and misalignment (radial and angular offset) between the encoder shaft and measured shaft. This relieves the encoder bearing of additional external loads that would otherwise shorten its service life. Diaphragm and metal bellows couplings designed to connect the rotor of the ROC/ROQ/ROD/RIC/RIQ encoders are available (see *Shaft Couplings*).

ROC/ROQ/ROD 400 and RIC/RIQ 400 series rotary encoders permit high bearing loads (see diagram). They can therefore also be mounted directly onto mechanical transfer elements such as gears or friction wheels.

If the encoder shaft is subject to relatively high loads, for example from friction wheels, pulleys, or sprockets, HEIDENHAIN recommends mounting the ECN/EQN/ERN 400 with a bearing assembly.

Bearing life span of ROC/ROQ/ROD 400 and RIC/RIQ 400

The lifetime of the shaft bearing depends on the shaft load, the shaft speed, and the point of force application. The values given in the specifications for the shaft load are valid for all permissible speeds, and do not limit the bearing lifetime. The diagram shows an example of the different bearing lifetimes to be expected at further loads. The different points of force application of shafts with 6 mm and 10 mm diameters have an effect on the bearing lifetime.

Rotary encoders with synchro flange

Mounting

- by the synchro flange with three fixing clamps or
- by fastening threaded holes on the encoder flange to an adapter flange (for ROC/ROQ/ROD 400 or RIC/RIQ 400).

Rotary encoders with synchro flange

Mounting accessories

Adapter flange

(electrically nonconducting)
ID 257044-01

Fixing clamps

For ROC/ROQ/ROD 400 and
RIC/RIQ 400 series

Safety-Related Position Measuring Systems

With the designation **Functional Safety**, HEIDENHAIN offers safety-related position measuring systems that are based on pure serial data transfer via EnDat 2.2 and can be used in safety-oriented applications. A safety-related position measuring system can be used as a single-encoder system in conjunction with a safe control in applications with control category SIL-2 (according to EN 61508/EN 61800-5-2) or performance level "d" (according to EN ISO 13849). Reliable transmission of the position is based on two independently generated absolute position values and on error bits. These are then provided to the safe control.

Basic principle

HEIDENHAIN measuring systems for safety-oriented applications are tested for compliance with EN ISO 13849-1 (successor to EN 954-1) as well as EN 61508 and EN 61800-5-2. These standards describe the assessment of safety-oriented systems, for example based on the failure probabilities of integrated components and subsystems.

This modular approach helps manufacturers of safety-oriented systems to implement their complete systems, because they can begin with subsystems that have already been qualified. Safety-related position measuring systems with purely serial data transmission via EnDat 2.2 accommodate this technique. In a safe drive, the safety-related position measuring system is such a subsystem. A **safety-related position measuring system** consists of:

- Encoder with EnDat 2.2 transmission component
- Data transfer line with EnDat 2.2 communication and HEIDENHAIN cable
- EnDat 2.2 receiver component with monitoring function (EnDat master)

In practice, the **complete "safe servo drive" system** consists of:

- Safety-related position measuring system
- Safety-oriented control (including EnDat master with monitoring functions)
- Power stage with motor power cable and drive
- Physical connection between encoder and drive (e.g. shaft connection/coupling)

Field of application

Safety-related position measuring systems from HEIDENHAIN are designed so that they can be used as single-encoder systems in applications with control category SIL-2 (according to EN 61508). This corresponds to performance level "d" of EN ISO 13849 or category 3 (according to EN 954-1). Also, the functions of the safety-related position measuring system can be used for the safety functions in the complete system (also see EN 61800-5-2) as listed in the table below:

SS1	Safe Stop 1
SS2	Safe Stop 2
SOS	Safe Operating Stop
SLA	Safely Limited Acceleration
SAR	Safe Acceleration Range
SLS	Safely Limited Speed
SSR	Safe Speed Range
SLP	Safely Limited Position
SLI	Safely Limited Increment
SDI	Safe Direction
SSM	Safe Speed Monitor

Safety functions according to EN 61800-5-2

Complete safe drive system

Function

The safety strategy of the position measuring system is based on two mutually independent position values and additional error bits produced in the encoder and transmitted over the EnDat 2.2 protocol to the EnDat master. The EnDat master assumes various monitoring functions with which errors in the encoder and during transmission can be revealed. The two position values are then compared. The EnDat master then makes the data available to the safe control. The control periodically tests the safety-related position measuring system to monitor its correct operation.

The architecture of the EnDat 2.2 protocol makes it possible to process all safety-relevant information and control mechanisms during unconstrained controller operation. This is possible because the safety-relevant information is saved in the additional information. According to EN 61508, the architecture of the position measuring system is regarded as a single-channel tested system.

Documentation on the integration of the position measuring system

The intended use of position measuring systems places demands on the control, the machine designer, the installation technician, service, etc. The necessary information is provided in the documentation for the position measuring systems.

In order to be able to implement a position measuring system in a safety-oriented application, a suitable control is required. The control assumes the fundamental task of communicating with the encoder and safely evaluating the encoder data.

The requirements for integrating the EnDat master with monitoring functions in the safe control are described in the document **"Specification of the E/E/PES safety requirements for the EnDat master and measures for safe control" (document 533095)**. It contains, for example, specifications on the evaluation and processing of position values and error bits, and on electrical connection and cyclic tests of position measuring systems.

Machine and plant manufacturers need not attend to these details. These functions must be provided by the control. Product information sheets, catalogs and mounting instructions provide information to aid the selection of a suitable encoder. The **product information sheets** and **catalogs** contain general data on function and application of the encoders as well as specifications and permissible ambient conditions. The **mounting instructions** provide detailed information on installing the encoders.

The architecture of the safety system and the diagnostic possibilities of the control may call for further requirements. **For example, the operating instructions of the control must explicitly state whether fault exclusion is required for the loosening of the mechanical connection between the encoder and the drive.** The machine designer is obliged to inform the installation technician and service technicians, for example, of the resulting requirements.

For more information on the topic of Functional Safety, refer to the Technical Information documents *Safety-Related Position Measuring Systems* and *Safety-Related Control Technology* as well as the Product Information document of the Functional Safety encoders.

General Mechanical Information

UL certification

All rotary encoders and cables in this brochure comply with the UL safety regulations for the USA and the "CSA" safety regulations for Canada.

Acceleration

Encoders are subject to various types of acceleration during operation and mounting.

• Vibration

The encoders are qualified on a test stand to operate with the specified acceleration values from 55 to 2000 Hz in accordance with EN 60068-2-6. However, if the application or poor mounting cause long-lasting resonant vibration, it can limit performance or even damage the encoder. **Comprehensive tests of the entire system are required.**

• Shock

The encoders are qualified on a test stand to operate with the specified acceleration values and duration in accordance with EN 60068-2-27. This does not include **permanent shock loads**, which **must be tested in the application.**

- The **maximum angular acceleration** is 10^5 rad/s^2 (DIN 32878). This is the highest permissible acceleration at which the rotor will rotate without damage to the encoder. The actually attainable angular acceleration lies in the same order of magnitude (for deviating values for ECN/ERN 100 see *Specifications*), but it depends on the type of shaft connection. A sufficient safety factor is to be determined through system tests.

Humidity

The max. permissible relative humidity is 75 %. 93 % is permissible temporarily. Condensation is not permissible.

Magnetic fields

Magnetic fields > 30 mT can impair the proper function of encoders. If required, please contact HEIDENHAIN, Traunreut.

RoHS

HEIDENHAIN has tested the products for harmlessness of the materials as per European Directives 2002/95/EC (RoHS) and 2002/96/EC (WEEE). For a Manufacturer Declaration on RoHS, please refer to your sales agency.

Natural frequencies

The rotor and the couplings of ROC/ROQ/ROD and RIC/RIQ rotary encoders, as also the stator and stator coupling of ECN/EQN/ERN rotary encoders, form a single vibrating spring-mass system.

The **natural frequency f_N** should be as high as possible. A prerequisite for the highest possible natural frequency on **ROC/ROQ/ROD rotary encoders** is the use of a diaphragm coupling with a high torsional rigidity C (see *Shaft Couplings*).

$$f_N = \frac{1}{2 \cdot \pi} \cdot \sqrt{\frac{C}{I}}$$

f_N : Natural frequency in Hz

C: Torsional rigidity of the coupling in Nm/rad

I: Moment of inertia of the rotor in kgm^2

ECN/EQN/ERN rotary encoders with their stator couplings form a vibrating spring-mass system whose **natural frequency f_N** should be as high as possible. If radial and/or axial acceleration forces are added, the stiffness of the encoder bearings and the encoder stators are also significant. If such loads occur in your application, HEIDENHAIN recommends consulting with the main facility in Traunreut.

Protection against contact (EN 60529)

After encoder installation, all rotating parts must be protected against accidental contact during operation.

Protection (EN 60529)

Unless otherwise indicated, all rotary encoders meet protection standard IP 64 (ExN/ROx 400: IP 67) according to EN 60529. This includes housings, cable outlets and flange sockets when the connector is fastened.

The **shaft inlet** provides protection to IP 64. Splash water should not contain any substances that would have harmful effects on the encoder parts. If the standard protection of the shaft inlet is not sufficient (such as when the encoders are mounted vertically), additional labyrinth seals should be provided.

Many encoders are also available with protection to class IP 66 for the shaft inlet. The sealing rings used to seal the shaft are subject to wear due to friction, the amount of which depends on the specific application.

Expendable parts

Encoders from HEIDENHAIN are designed for a long service life. Preventive maintenance is not required. They contain components that are subject to wear, depending on the application and manipulation. These include in particular cables with frequent flexing.

Other such components are the bearings of encoders with integral bearing, shaft sealing rings on rotary and angle encoders, and sealing lips on sealed linear encoders.

System tests

Encoders from HEIDENHAIN are usually integrated as components in larger systems. Such applications require **comprehensive tests of the entire system** regardless of the specifications of the encoder.

The specifications given in this brochure apply to the specific encoder, not to the complete system. Any operation of the encoder outside of the specified range or for any other than the intended applications is at the user's own risk.

Mounting

Work steps to be performed and dimensions to be maintained during mounting are specified solely in the mounting instructions supplied with the unit. All data in this catalog regarding mounting are therefore provisional and not binding; they do not become terms of a contract.

Changes to the encoder

The correct operation and accuracy of encoders from HEIDENHAIN is ensured only if they have not been modified. Any changes, even minor ones, can impair the operation and reliability of the encoders, and result in a loss of warranty. This also includes the use of additional retaining compounds, lubricants (e.g. for screws) or adhesives not explicitly prescribed. In case of doubt, we recommend contacting HEIDENHAIN in Traunreut.

Temperature ranges

For the unit in its packaging, the **storage temperature range** is –30 to 80 °C (HR 1120: –30 to 70 °C). The **operating temperature range** indicates the temperatures that the encoder may reach during operation in the actual installation environment. The function of the encoder is guaranteed within this range (DIN 32878). The operating temperature is measured on the face of the encoder flange (see dimension drawing) and must not be confused with the ambient temperature.

The temperature of the encoder is influenced by:

- Mounting conditions
- The ambient temperature
- Self-heating of the encoder

The self-heating of an encoder depends both on its design characteristics (stator coupling/solid shaft, shaft sealing ring, etc.) and on the operating parameters (rotational speed, power supply). Temporarily increased self-heating can also occur after very long breaks in operation (of several months). Please take a two-minute run-in period at low speeds into account. Higher heat generation in the encoder means that a lower ambient temperature is required to keep the encoder within its permissible operating temperature range.

These tables show the approximate values of self-heating to be expected in the encoders. In the worst case, a combination of operating parameters can exacerbate self-heating, for example a 30 V power supply and maximum rotational speed. Therefore, the actual operating temperature should be measured directly at the encoder if the encoder is operated near the limits of permissible parameters. Then suitable measures should be taken (fan, heat sinks, etc.) to reduce the ambient temperature far enough so that the maximum permissible operating temperature will not be exceeded during continuous operation.

For high speeds at maximum permissible ambient temperature, special versions are available on request with reduced degree of protection (without shaft seal and its concomitant frictional heat).

Self-heating at supply voltage		15 V	30 V
	ERN/ROD	Approx. + 5 K	Approx. + 10 K
	ECN/EQN/ROC/ROQ/RIC/RIQ	Approx. + 5 K	Approx. + 10 K
Heat generation at speed n _{max}			
Solid shaft	ROC/ROQ/ROD/RIC/RIQ	Approx. + 5 K with IP 64 protection Approx. + 10 K with IP 66 protection	
Blind hollow shaft	ECN/EQN/ERN 400	Approx. + 30 K with IP 64 protection Approx. + 40 K with IP 66 protection	
	ECN/EQN/ERN 1000	Approx. + 10 K	
Hollow through shaft	ECN/ERN 100 ECN/EQN/ERN 400	Approx. + 40 K with IP 64 protection Approx. + 50 K with IP 66 protection	

An encoder's typical self-heating values depend on its design characteristics at maximum permissible speed. The correlation between rotational speed and heat generation is nearly linear.

Measuring the actual operating temperature at the defined measuring point of the rotary encoder (see *Specifications*)

Mounting information

The HR 1120 is designed for mounting in a panel. CE compliance of the complete system must be ensured by taking the correct measures during installation.

Interfaces

Incremental Signals $\sim 1 V_{PP}$

HEIDENHAIN encoders with $\sim 1 V_{PP}$ interface provide voltage signals that can be highly interpolated.

The sinusoidal **incremental signals A** and **B** are phase-shifted by 90° elec. and have an amplitude of typically $1 V_{PP}$. The illustrated sequence of output signals—with **B** lagging **A**—applies for the direction of motion shown in the dimension drawing.

The **reference mark signal R** has a usable component **G** of approx. $0.5 V$. Next to the reference mark, the output signal can be reduced by up to $1.7 V$ to a quiescent level **H**. This must not cause the subsequent electronics to overdrive. Even at the lowered signal level, signal peaks with the amplitude **G** can also appear.

The data on **signal amplitude** apply when the power supply given in the specifications is connected to the encoder. They refer to a differential measurement at the 120 ohm terminating resistor between the associated outputs. The signal amplitude decreases with increasing frequency. The **cutoff frequency** indicates the scanning frequency at which a certain percentage of the original signal amplitude is maintained:

- $-3 \text{ dB} \triangleq 70\%$ of the signal amplitude
- $-6 \text{ dB} \triangleq 50\%$ of the signal amplitude

The data in the signal description apply to motions at up to 20% of the -3 dB cutoff frequency.

Interpolation/resolution/measuring step

The output signals of the $1 V_{PP}$ interface are usually interpolated in the subsequent electronics in order to attain sufficiently high resolutions. For **velocity control**, interpolation factors are commonly over 1000 in order to receive usable velocity information even at low speeds.

Measuring steps for **position measurement** are recommended in the specifications. For special applications, other resolutions are also possible.

Short-circuit stability

A temporary short circuit of one signal output to $0 V$ or U_P (except encoders with $U_{Pmin} = 3.6 V$) does not cause encoder failure, but it is not a permissible operating condition.

Short circuit at	$20^\circ C$	$125^\circ C$
One output	$< 3 \text{ min}$	$< 1 \text{ min}$
All outputs	$< 20 \text{ s}$	$< 5 \text{ s}$

Reference-mark signal	One or several signal peaks R Usable component G : $\geq 0.2 V$ Quiescent value H : $\leq 1.7 V$ Switching threshold E , F : 0.04 to $0.68 V$ Zero crossovers K , L : $180^\circ \pm 90^\circ$ elec.
Connecting cable	Shielded HEIDENHAIN cable PUR $[4(2 \times 0.14 \text{ mm}^2) + (4 \times 0.5 \text{ mm}^2)]$ Max. 150 m at 90 pF/m distributed capacitance 6 ns/m
Cable length	
Propagation time	

These values can be used for dimensioning of the subsequent electronics. Any limited tolerances in the encoders are listed in the specifications. For encoders without integral bearing, reduced tolerances are recommended for initial operation (see the mounting instructions).

Cutoff frequency

Interfaces

Incremental Signals TTL

HEIDENHAIN encoders with  TTL interface incorporate electronics that digitize sinusoidal scanning signals with or without interpolation.

The **incremental signals** are transmitted as the square-wave pulse trains U_{a1} and U_{a2} , phase-shifted by 90° elec. The **reference mark signal** consists of one or more reference pulses U_{a0} , which are gated with the incremental signals. In addition, the integrated electronics produce their **inverted signals** $\overline{U_{a1}}$, $\overline{U_{a2}}$ and $\overline{U_{a0}}$ for noise-proof transmission. The illustrated sequence of output signals—with U_{a2} lagging U_{a1} —applies to the direction of motion shown in the dimension drawing.

The **fault-detection signal** $\overline{U_{aS}}$ indicates fault conditions such as breakage of the power line or failure of the light source. It can be used for such purposes as machine shut-off during automated production.

The distance between two successive edges of the incremental signals U_{a1} and U_{a2} through 1-fold, 2-fold or 4-fold evaluation is one **measuring step**.

The subsequent electronics must be designed to detect each edge of the square-wave pulse. The minimum **edge separation a** listed in the *Specifications* applies to the illustrated input circuitry with a cable length of 1 m, and refers to a measurement at the output of the differential line receiver. Propagation-time differences in cables additionally reduce the edge separation by 0.2 ns per meter of cable length. To prevent counting errors, design the subsequent electronics to process as little as 90 % of the resulting edge separation. The max. permissible **shaft speed** or **traversing velocity** must never be exceeded.

The permissible **cable length** for transmission of the TTL square-wave signals to the subsequent electronics depends on the edge separation a . It is at most 100 m, or 50 m for the fault detection signal. This requires, however, that the power supply (see *Specifications*) be ensured at the encoder. The sensor lines can be used to measure the voltage at the encoder and, if required, correct it with an automatic control system (remote sense power supply).

A shielded cable with a cross section of at least 0.5 mm² is recommended when connecting the handwheel to the power supply.

The handwheel is connected electrically via screw terminals. The appropriate wire end sleeves must be attached to the wires.

Interfaces

Incremental Signals HTL

HEIDENHAIN encoders with  HTL interface incorporate electronics that digitize sinusoidal scanning signals with or without interpolation.

The **incremental signals** are transmitted as the square-wave pulse trains U_{a1} and U_{a2} , phase-shifted by 90° elec. The **reference mark signal** consists of one or more reference pulses U_{a0} , which are gated with the incremental signals. In addition, the integrated electronics produce their **inverted signals** $\overline{U_{a1}}$, $\overline{U_{a2}}$ and $\overline{U_{a0}}$ for noise-proof transmission (does not apply to HTLs). The illustrated sequence of output signals—with U_{a2} lagging U_{a1} —applies to the direction of motion shown in the dimension drawing.

The **fault-detection signal** $\overline{U_{aS}}$ indicates fault conditions such as failure of the light source. It can be used for such purposes as machine shut-off during automated production.

The distance between two successive edges of the incremental signals U_{a1} and U_{a2} through 1-fold, 2-fold or 4-fold evaluation is one **measuring step**.

The subsequent electronics must be designed to detect each edge of the square-wave pulse. The minimum **edge separation a** listed in the *Specifications* refers to a measurement at the output of the given differential input circuitry. To prevent counting errors, the subsequent electronics should be designed to process as little as 90 % of the edge separation a. The max. permissible **shaft speed** or **traversing velocity** must never be exceeded.

The permissible **cable length** for incremental encoders with HTL signals depends on the scanning frequency, the effective power supply, and the operating temperature of the encoder.

Switching times	$t_+/t_- \leq 200$ ns (except $\overline{U_{aS}}$) with 1 m cable and recommended input circuitry	
Connecting cables	HEIDENHAIN cable with shielding PUR $[4(2 \times 0.14 \text{ mm}^2) + (4 \times 0.5 \text{ mm}^2)]$ Max. 300 m (HTLs max. 100 m) at distributed capacitance 90 pF/m 6 ns/m	
Cable length		
Propagation time		

Current consumption

The current consumption for encoders with HTL output signals depends on the output frequency and the cable length to the subsequent electronics. The diagrams show typical curves for push-pull transmission with a 12-line HEIDENHAIN cable. The maximum current consumption can be 50 mA higher.

Interfaces

Absolute Position Values

The EnDat interface is a digital, **bidirectional** interface for encoders. It is capable both of transmitting **position values** as well as transmitting or updating information stored in the encoder, or saving new information. Thanks to the **serial transmission method**, only **four signal lines** are required. The data is transmitted in **synchronism** with the clock signal from the subsequent electronics. The type of transmission (position values, parameters, diagnostics, etc.) is selected through mode commands that the subsequent electronics send to the encoder. Some functions are available only with EnDat 2.2 mode commands.

For more information, refer to the *EnDat* Technical Information sheet or visit www.endat.de.

Position values can be transmitted with or without additional information (e.g. position value 2, temperature sensors, diagnostics, limit position signals).

Besides the position, additional information can be interrogated in the closed loop and functions can be performed with the EnDat 2.2 interface.

Parameters are saved in various memory areas, e.g.:

- Encoder-specific information
- Information of the OEM (e.g. "electronic ID label" of the motor)
- Operating parameters (datum shift, instruction, etc.)
- Operating status (alarm or warning messages)

Monitoring and diagnostic functions of the EnDat interface make a detailed inspection of the encoder possible.

- Error messages
- Warnings
- Online diagnostics based on valuation numbers (EnDat 2.2)

Incremental signals

EnDat encoders are available with or without incremental signals. EnDat 21 and EnDat 22 encoders feature a high internal resolution. An evaluation of the incremental signal is therefore unnecessary.

Clock frequency and cable length

The clock frequency is variable—depending on the cable length (max. 150 m)—between **100 kHz** and **2 MHz**. With propagation-delay compensation in the subsequent electronics, clock frequencies **up to 16 MHz** at cable lengths up to 100 m are possible (for other values see *Specifications*).

Interface	EnDat serial bidirectional
Data transfer	Absolute position values, parameters and additional information
Data input	Differential line receiver according to EIA standard RS 485 for the signals $\overline{\text{CLOCK}}$, $\overline{\text{CLOCK}}$, DATA and $\overline{\text{DATA}}$

Interface

PROFIBUS-DP Absolute Position Values

PROFIBUS DP

PROFIBUS is a nonproprietary, open field bus in accordance with the international EN 50170 standard. The connecting of sensors through field bus systems minimizes the cost of cabling and reduces the number of lines between encoder and subsequent electronics.

Topology and bus assignment

The PROFIBUS-DP is designed as a linear structure. It permits transfer rates up to 12 Mbps. Both mono-master and multi-master systems are possible. Each master can serve only its own slaves (polling). The slaves are polled cyclically by the master. Slaves are, for example, sensors such as absolute rotary encoders, linear encoders, or also control devices such as motor frequency inverters.

Physical characteristics

The electrical features of the PROFIBUS-DP comply with the RS-485 standard. The bus connection is a shielded, twisted two-wire cable with active bus terminations at each end.

Bus structure of PROFIBUS-DP

Initial configuration

The characteristics of HEIDENHAIN encoders required for system configuration are included as "electronic data sheets"—also called device identification records (GSD)—in the gateway. These device identification records (GSD) completely and clearly describe the characteristics of a unit in an exactly defined format. This makes it possible to integrate the encoders into the bus system in a simple and application-friendly way.

Configuration

PROFIBUS-DP devices can be configured and the parameters assigned to fit the requirements of the user. Once these settings are made in the configuration tool with the aid of the GSD file, they are saved in the master. It then configures the PROFIBUS devices every time the network starts up. This simplifies exchanging the devices: there is no need to edit or reenter the configuration data.

* With EnDat interface

Two different GSD files are available for selection:

- GSD file for the DP-V0 profile
- GSD file for the DP-V1 and DP-V2 profiles

PROFIBUS-DP profile

The PNO (PROFIBUS user organization) has defined standard, nonproprietary profiles for the connection of absolute encoders to the PROFIBUS-DP. This ensures high flexibility and simple configuration on all systems that use these standardized profiles.

DP-V0 profile

This profile can be obtained from the Profibus user organization (PNO) in Karlsruhe, Germany, under the order number 3.062. There are two classes defined in the profile, where class 1 provides minimum support, and class 2 allows additional, in part optional functions.

DP-V1 and DP-V2 profiles

These profiles can be obtained from the Profibus user organization (PNO) in Karlsruhe, Germany, under the order number 3.162. This profile also distinguishes between two device classes:

- Class 3 with the basic functions and
- Class 4 with the full range of scaling and preset functions.

Optional functions are defined in addition to the mandatory functions of classes 3 and 4.

Supported functions

Particularly important in decentralized field bus systems are the **diagnostic functions** (e.g. warnings and alarms), and the **electronic ID label** with information on the type of encoder, resolution, and measuring range. But also programming functions such as counting direction reversal, **preset/zero shift** and **changing the resolution (scaling)** are possible. The **operating time** and the **velocity** of the encoder can also be recorded.

Function of Class DP-V0

Feature <i>Data word width</i>	Class	Rotational encoders		Linear encoders $\leq 31 \text{ bits}^{1)}$
		$\leq 16 \text{ bits}$	$\leq 31 \text{ bits}^{1)}$

¹⁾ Not supported by DP V2

Encoders with PROFIBUS-DP

The absolute rotary encoders with **integrated PROFIBUS-DP interface** are connected directly to the PROFIBUS. LEDs on the rear of the encoder display the power supply and bus status **operating states**.

The coding switches for the addressing (0 to 99) and for selecting the terminating resistor are easily accessible under the bus housing. The terminating resistor is to be activated if the rotary encoder is the last participant on the PROFIBUS-DP and the external terminating resistor is not used.

Accessory:

Adapter M12 (male), 4-pin, B-coded
Fits 5-pin bus output, with PROFIBUS terminating resistor. Required for last participant if the encoder's internal terminating resistor is not to be used.
ID 584217-01

Connection

PROFIBUS-DP and the power supply are connected via the M12 connecting elements. The necessary mating connectors are:

Bus input:

M12 connector (female), 5-pin, B-coded

Bus output:

M12 coupling (male), 5-pin, B-coded

Power supply:

M12 connector, 4-pin, A-coded

Encoders with EnDat interface

All absolute encoders from HEIDENHAIN with EnDat interface can be connected to the PROFIBUS-DP over a **gateway**. The information available via PROFIBUS is generated on the basis of the EnDat 21 interface regardless of the encoder interface. The position value corresponds to the absolute value transmitted via the EnDat interface without interpolation of the 1 V_{PP} signals. The complete interface electronics are integrated in the gateway, as well as a voltage converter for supplying EnDat encoders with 5 V DC ± 5 %. This offers a number of benefits:

- Simple connection of the field bus cable, since the terminals are easily accessible.
- Encoder dimensions remain small.
- No temperature restrictions for the encoder. All temperature-sensitive components are in the gateway.

Besides the EnDat encoder connector, the gateway provides connections for the PROFIBUS and the power supply. In the gateway there are coding switches for addressing and selecting the terminating resistor. Since the gateway is connected directly to the bus lines, the cable to the encoder is not a stub line, although it can be up to 150 meters long.

For more information, see the **Gateway** Product Information sheet.

Specifications	PROFIBUS DP Gateway
Input	Absolute encoders with EnDat interface
Connection*	M12 flange socket (female) 8-pin or M23 flange socket (female) 17-pin
Cable length	≤ 40 m (with HEIDENHAIN cable)
Output	PROFIBUS DP-V0, classes 1 and 2 PROFIBUS DP-V1, DP-V2, classes 3 and 4 Integrated T-junction and bus termination (can be switched off)
PROFIBUS clock frequency	9.6 kb/s to 12 Mb/s
Bus connection* (bus in, bus out, power)	3 x M12 connecting element, 4 or 5 pins, or 3 x PG ¹⁾ cable gland (terminal strip in the device)
Cable length	≤ 400 m for 1.5 Mb/s ≤ 100 m for 12 Mb/s
Power supply	9 to 36 V DC
Operating temperature	−40 to 80 °C
Protection EN 60529	IP 65
Fastening	Top-hat rail mounting ²⁾

²⁾ Maximum values, depending on whether M12 or M23

Interface

Absolute Position Values PROFINET IO

PROFINET IO

PROFINET IO is the open Industrial Ethernet Standard for industrial communication. It builds on the field-proven function model of PROFIBUS-DP, however is used fast Ethernet technology as physical transmission medium and is therefore tailored for fast transmission of I/O data. It offers the possibility of transmission for required data, parameters and IT functions at the same time.

PROFINET makes it possible to connect local field devices to a controller and describe the data exchange between the controller and the field devices, as well as the parameterization and programming. The PROFINET technique is arranged in modules. Cascading functions can be selected by the user himself. These functions differ essentially in the type of data exchange in order to satisfy high requirements on velocity.

Topology and bus assignment

A PROFINET-IO system consists of:

- **IO controller** (control/PLC, controls the automation task)
- **IO device** (local field device, e.g. rotary encoder)
- **IO supervisor** (development or diagnostics tool, e.g. PC or programming device)

PROFINET IO functions according to the provider-consumer model, which supports communication between Ethernet peers. An advantage is that the provider transmits its data without any prompting by the communication partner.

Physical characteristics

HEIDENHAIN encoders are connected according to 100BASE-TX (IEEE 802.3 Clause 25) through one shielded, twisted wire pair per direction to PROFINET. The transmission rate is 100 Mbit/s (Fast Ethernet).

PROFINET profile

HEIDENHAIN encoders fulfill the definitions as per Profile 3.162, Version 4.1. The device profile describes the encoder functions. Class 4 (full scaling and preset) functions are supported. More detailed information on PROFINET can be ordered from the PROFIBUS User Organization PNO.

Initial configuration

To put an encoder with a PROFINET interface into operation, a device identification record (GSD) must be downloaded and imported into the configuration software. The GSD contains the execution parameters required for a PROFINET-IO device.

Configuration

Profiles are predefined configurations of available functions and performance characteristics of PROFINET for use in certain devices or applications such as rotary encoders. They are defined and published by the workgroups of the PROFIBUS & PROFINET International (PI).

Profiles are important for openness, interoperability and exchangeability so that the end user can be sure that similar devices from different manufacturers function in a standardized manner.

Encoders with PROFINET

The absolute rotary encoders with integrated PROFIBUS interface are connected directly to the network. Addresses are distributed automatically over a protocol integrated in PROFINET. A PROFINET-IO field device is addressed within a network through its physical device MAC address.

On their rear faces, the encoders feature two double-color LIDs for diagnostics of the bus and the device.

A terminating resistor for the last participant is not necessary.

Connection

PROFINET and the power supply are connected via the M12 connecting elements. The necessary mating connectors are:

- PORTs 1 and 2: M12 coupling (male), 4-pin, D-coded
- Power supply: M12 connector, 4-pin, A-coded

Pin Layout

Interfaces

SSI Absolute Position Values

The **absolute position value** beginning with the Most Significant Bit (MSB first) is transferred on the DATA lines in synchronism with a CLOCK signal transmitted by the control. The SSI standard data word length for singleturn absolute encoders is 13 bits, and for multiturn absolute encoders 25 bits. In addition to the absolute position values, sinusoidal **incremental signals** with 1- V_{PP} levels are transmitted. For signal description see *Incremental signals 1 V_{PP}* .

For the ECN/EQN 4xx and ROC/ROQ 4xx rotary encoders, the following **functions** can be activated via the programming inputs of the interfaces by applying the supply voltage U_P :

- **Direction of rotation**
Continuous application of a HIGH level to pin 2 reverses the direction of rotation for ascending position values.
- **Zeroing** (datum setting)
Applying a positive edge ($t_{min} > 1\text{ ms}$) to pin 5 sets the current position to zero.

Note: The programming inputs must always be terminated with a resistor (see Input Circuitry of the Subsequent Electronics).

Interface	SSI serial
Ordering designation	<i>Singleturn:</i> SSI 39r1 <i>Multiturn:</i> SSI 41r1

Cable length	
Propagation time	

Control cycle for complete data format
When not transmitting, the clock and data lines are on high level. The internally and cyclically formed position value is stored on the first falling edge of the clock. The stored data is then clocked out on the first rising edge.

After transmission of a complete data word, the data line remains low for a period of time (t_2) until the encoder is ready for interrogation of a new value. Encoders with SSI 39r1 and SSI 41r1 interfaces additionally require a subsequent clock pause t_R . If another data-output request (CLOCK) is received within this time (t_2 or t_2+t_R), the same data will be output once again.

If the data output is interrupted (CLOCK = high for $t \geq t_2$), a new position value will be stored on the next falling edge of the clock. With the next rising clock edge the subsequent electronics adopts the data.

Encoder inputs	Two D-sub connections (15-pin, male)			
Input frequency	$\leq 500 \text{ kHz}$	$\leq 33 \text{ kHz}$	–	
Cable length	$\leq 60 \text{ m}$		$\leq 50 \text{ m}$	$\leq 10 \text{ m}$
Signal subdivision (signal period : meas. step)	Up to 4096-fold			
Data register for measured values (per channel)	48 bits (44 bits used)			
Internal memory	For 8192 position values			
Interface	PCI bus			
Driver software and demonstration program	For Windows 98/NT/2000/XP in VISUAL C++, VISUAL BASIC and BORLAND DELPHI			
Dimensions	Approx. 190 mm × 100 mm			

EIB 741

External Interface Box

The EIB 741 is ideal for applications requiring high resolution, fast measured-value acquisition, mobile data acquisition or data storage.

Up to four incremental or absolute HEIDENHAIN encoders can be connected to the EIB 741. The data is output over a standard Ethernet interface.

For more information, see the *EIB 741* Product Information sheet.

	EIB 741		
Encoder inputs switchable	 1 V _{pp}	EnDat 2.1	EnDat 2.2
Connection	Four D-sub connections (15-pin, female)		
Input frequency	≤ 500 kHz	–	
Signal subdivision	4 096-fold	–	
Internal memory	Typically 250 000 position values per input		
Interface	Ethernet as per IEEE 802.3 (≤ 1 Gbit)		
Driver software and demo program	For Windows, Linux, LabView Example programs		

HEIDENHAIN Measuring Equipment

For Incremental Encoders

PWM 9 is a universal measuring device for checking and adjusting HEIDENHAIN incremental encoders. Expansion modules are available for checking the various types of encoder signals. The values can be read on an LCD monitor. Soft keys provide ease of operation.

	PWM 9
Inputs	Expansion modules (interface boards) for 11 μ App; 1 Vpp; TTL; HTL; EnDat*/SSI*/commutation signals *No display of position values or parameters
Functions	• Measures signal amplitudes, current consumption, operating voltage, scanning frequency • Graphically displays incremental signals (amplitudes, phase angle and on-off ratio) and the reference-mark signal (width and position) • Displays symbols for the reference mark, fault detection signal, counting direction • Universal counter, interpolation selectable from single to 1 024-fold • Adjustment support for exposed linear encoders
Outputs	• Inputs are connected through to the subsequent electronics • BNC sockets for connection to an oscilloscope
Power supply	10 to 30 V DC, max. 15 W
Dimensions	150 mm x 205 mm x 96 mm

The **PWT** is a simple adjusting aid for HEIDENHAIN incremental encoders. In a small LCD window the signals are shown as bar charts with reference to their tolerance limits.

	PWT 10	PWT 17	PWT 18
Encoder input	~ 11 μ App	□□TTL	~ 1 Vpp
Functions	Measurement of the signal amplitude Tolerance of signal shape Amplitude and position of the reference-mark signal		
Power supply	Via power supply unit (included)		
Dimensions	114 mm x 64 mm x 29 mm		

For Absolute Encoders

The **PWM 20** phase angle measuring unit serves together with the provided ATS adjusting and testing software for diagnosis and adjustment of HEIDENHAIN encoders.

	PWM 20
Encoder input	• EnDat 2.1 or EnDat 2.2 (absolute value with/without incremental signals) • DRIVE-CLiQ • FANUC serial interface • Mitsubishi High Speed Serial Interface • SSI
Interface	USB 2.0
Power supply	100 V AC to 240 V AC or 24 V DC
Dimensions	258 mm 154 mm 55 mm

	ATS
Languages	Choice between English or German
Functions	• Position display • Connection dialog • Diagnostics • Mounting wizard for EBI/ECI/EQI, LIP 200, LIC 4000 • Additional functions (if supported by the encoder) • Memory contents
System requirements	PC (Dual-Core processor; > 2 GHz); main memory > 1 GB; Windows XP, Vista, 7 (32-bit); 100 MB free space on hard disk

General Electrical Information

Power Supply

Connect HEIDENHAIN encoders only to subsequent electronics whose power supply is generated from PELV systems (**EN 50178**). In addition, overcurrent protection and overvoltage protection are required in safety-related applications.

If HEIDENHAIN encoders are to be operated in accordance with IEC 61010-1, power must be supplied from a secondary circuit with current or power limitation as per IEC 61010-1:2001, section 9.3 or IEC 60950-1:2005, section 2.5 or a Class 2 secondary circuit as specified in UL1310.

The encoders require a **stabilized DC voltage U_p** as power supply. The respective *Specifications* state the required power supply and the current consumption. The permissible ripple content of the DC voltage is:

- High frequency interference
 $U_{PP} < 250 \text{ mV}$ with $dU/dt > 5 \text{ V}/\mu\text{s}$
- Low frequency fundamental ripple
 $U_{PP} < 100 \text{ mV}$

The values apply as measured at the encoder, i.e., without cable influences. The voltage can be monitored and adjusted with the encoder's **sensor lines**. If a controllable power supply is not available, the voltage drop can be halved by switching the sensor lines parallel to the corresponding power lines.

Calculation of the **voltage drop**:

$$\Delta U = 2 \cdot 10^{-3} \cdot \frac{1.05 \cdot L_C \cdot I}{56 \cdot A_P}$$

where ΔU : Voltage drop in V

1.05: Length factor due to twisted wires

L_C : Cable length in m

I : Current consumption in mA

A_P : Cross section of power lines in mm^2

The voltage actually applied to the encoder is to be considered when **calculating the encoder's power requirement**. This voltage consists of the supply voltage U_p provided by the subsequent electronics minus the line drop at the encoder. For encoders with an expanded supply range, the voltage drop in the power lines must be calculated under consideration of the nonlinear current consumption (see next page).

If the voltage drop is known, all parameters for the encoder and subsequent electronics can be calculated, e.g. voltage at the encoder, current requirements and power consumption of the encoder, as well as the power to be provided by the subsequent electronics.

Switch-on/off behavior of the encoders

The output signals are valid no sooner than after switch-on time $t_{SOT} = 1.3 \text{ s}$ (2 s for PROFIBUS-DP) (see diagram). During time t_{SOT} they can have any levels up to 5.5 V (with HTL encoders up to U_{Pmax}). If an interpolation electronics unit is inserted between the encoder and the power supply, this unit's switch-on/off characteristics must also be considered. If the power supply is switched off, or when the supply voltage falls below U_{min} , the output signals are also invalid. During restart, the signal level

must remain below 1 V for the time t_{SOT} before power on. These data apply to the encoders listed in the catalog—customer-specific interfaces are not included.

Encoders with new features and increased performance range may take longer to switch on (longer time t_{SOT}). If you are responsible for developing subsequent electronics, please contact HEIDENHAIN in good time.

Insulation

The encoder housings are isolated against internal circuits.

Rated surge voltage: 500 V
(preferred value as per VDE 0110 Part 1, overvoltage category II, contamination level 2)

Encoders with expanded supply voltage range

For encoders with expanded supply voltage range, the current consumption has a nonlinear relationship with the supply voltage. On the other hand, the power consumption follows a linear curve (see *Current and power consumption* diagram). The maximum power consumption at minimum and maximum supply voltage is listed in the **Specifications**. The maximum power consumption (worst case) accounts for:

- Recommended receiver circuit
- Cable length 1 m
- Age and temperature influences
- Proper use of the encoder with respect to clock frequency and cycle time

The typical current consumption at no load (only supply voltage is connected) for 5 V supply is specified.

The actual power consumption of the encoder and the required power output of the subsequent electronics are measured, while taking the voltage drop on the supply lines into consideration, in four steps:

Step 1: Resistance of the supply lines

The resistance values of the supply lines (adapter cable and encoder cable) can be calculated with the following formula:

$$R_L = 2 \cdot \frac{1.05 \cdot L_C}{56 \cdot A_P}$$

Step 2: Coefficients for calculation of the drop in line voltage

$$b = -R_L \cdot \frac{P_{E_{\max}} - P_{E_{\min}}}{U_{E_{\max}} - U_{E_{\min}}} - U_P$$

$$c = P_{E_{\min}} \cdot R_L + \frac{P_{E_{\max}} - P_{E_{\min}}}{U_{E_{\max}} - U_{E_{\min}}} \cdot R_L \cdot (U_P - U_{E_{\min}})$$

Step 3: Voltage drop based on the coefficients b and c

$$\Delta U = -0.5 \cdot (b + \sqrt{b^2 - 4 \cdot c})$$

Where:

$U_{E_{\max}}$,
 $U_{E_{\min}}$: Minimum or maximum supply voltage of the encoder in V

$P_{E_{\min}}$,
 $P_{E_{\max}}$: Maximum power consumption at minimum or maximum power supply, respectively, in W

U_P : Supply voltage of the subsequent electronics in V

Step 4: Parameters for subsequent electronics and the encoder

Voltage at encoder:

$$U_E = U_P - \Delta U$$

Current requirement of encoder:

$$I_E = \Delta U / R_L$$

Power consumption of encoder:

$$P_E = U_E \cdot I_E$$

Power output of subsequent electronics:

$$P_S = U_P \cdot I_E$$

R_L : Cable resistance (for both directions) in ohms

ΔU : Voltage drop in the cable in V

1.05: Length factor due to twisted wires

L_C : Cable length in m

A_P : Cross section of power lines in mm²

Influence of cable length on the power output of the subsequent electronics (example representation)

Current and power consumption with respect to the supply voltage (example representation)

Electrically Permissible Speed/ Traversing Speed

The maximum permissible shaft speed or traversing velocity of an encoder is derived from

- the **mechanically** permissible shaft speed/traversing velocity (if listed in the *Specifications*) and
- the **electrically** permissible shaft speed/traversing velocity.

For encoders with **sinusoidal output signals**, the electrically permissible shaft speed/traversing velocity is limited by the –3 dB/–6 dB cutoff frequency or the permissible input frequency of the subsequent electronics.

For encoders with **square-wave signals**, the electrically permissible shaft speed/traversing velocity is limited by

- the maximum permissible scanning/output frequency $f_{\max}$ of the encoder, and
- the minimum permissible edge separation a for the subsequent electronics.

For angle or rotary encoders

$$n_{\max} = \frac{f_{\max}}{z} \cdot 60 \cdot 10^3$$

For linear encoders

$$v_{\max} = f_{\max} \cdot SP \cdot 60 \cdot 10^{-3}$$

Where:

$n_{\max}$: Elec. permissible speed in min^{-1}

$v_{\max}$: Elec. permissible traversing velocity in m/min

$f_{\max}$: Max. scanning/output frequency of encoder or input frequency of subsequent electronics in kHz

z : Line count of the angle or rotary encoder per 360°

SP : Signal period of the linear encoder in μm

Cable

For safety-related applications, use HEIDENHAIN cables and connectors.

Versions

The cables of almost all HEIDENHAIN encoders and all adapter and connecting cables are sheathed in **polyurethane (PUR cables)**. Most adapter cables for within motors and a few cables on encoders are sheathed in a **special elastomer (EPG cables)**. These cables are identified in the specifications or in the cable tables with "EPG".

Durability

PUR cables are resistant to oil and hydrolysis in accordance with **VDE 0472** (Part 803/test type B) and resistant to microbes in accordance with **VDE 0282** (Part 10). They are free of PVC and silicone and comply with UL safety directives. The **UL certification** AWM STYLE 20963 80 °C 30 V E63216 is documented on the cable.

EPG cables are resistant to oil in accordance with **VDE 0472** (Part 803/test type B) and to hydrolysis in accordance with **VDE 0282** (Part 10). They are free of silicone and halogens. In comparison with PUR cables, they are only somewhat resistant to media, frequent flexing and continuous torsion.

Temperature range

HEIDENHAIN cables can be used for

Rigid configuration (PUR)	–40 to 80 °C
Rigid configuration (EPG)	–40 to 120 °C
Frequent flexing (PUR)	–10 to 80 °C

PUR cables with limited resistance to hydrolysis and microbes are rated for up to 100 °C. If needed, please ask for assistance from HEIDENHAIN Traunreut.

Lengths

The **cable lengths** listed in the *Specifications* apply only for HEIDENHAIN cables and the recommended input circuitry of subsequent electronics.

Cable	Bend radius R	
	Rigid configuration	Frequent flexing
Ø 3.7 mm	≥ 8 mm	≥ 40 mm
Ø 4.3 mm	≥ 10 mm	≥ 50 mm
Ø 4.5 mm EPG	≥ 18 mm	–
Ø 4.5 mm Ø 5.1 mm	≥ 10 mm	≥ 50 mm
Ø 6 mm Ø 10 mm ¹⁾	≥ 20 mm ≥ 35 mm	≥ 75 mm ≥ 75 mm
Ø 8 mm Ø 14 mm ¹⁾	≥ 40 mm ≥ 100 mm	≥ 100 mm ≥ 100 mm

¹⁾ Metal armor

Noise-Free Signal Transmission

Electromagnetic compatibility/ CE compliance

When properly installed, and when HEIDENHAIN connecting cables and cable assemblies are used, HEIDENHAIN encoders fulfill the requirements for electromagnetic compatibility according to 2004/108/EC with respect to the generic standards for:

- **Noise immunity EN 61000-6-2:**

Specifically:

- ESD EN 61000-4-2
- Electromagnetic fields EN 61000-4-3
- Burst EN 61000-4-4
- Surge EN 61000-4-5
- Conducted disturbances EN 61000-4-6
- Power frequency magnetic fields EN 61000-4-8
- Pulse magnetic fields EN 61000-4-9

- **Interference EN 61000-6-4:**

Specifically:

- For industrial, scientific and medical equipment (ISM) EN 55011
- For information technology equipment EN 55022

Transmission of measuring signals— electrical noise immunity

Noise voltages arise mainly through capacitive or inductive transfer. Electrical noise can be introduced into the system over signal lines and input or output terminals.

Possible sources of noise include:

- Strong magnetic fields from transformers, brakes and electric motors
- Relays, contactors and solenoid valves
- High-frequency equipment, pulse devices, and stray magnetic fields from switch-mode power supplies
- AC power lines and supply lines to the above devices

Protection against electrical noise

The following measures must be taken to ensure disturbance-free operation:

- Use only original HEIDENHAIN cables. Consider the voltage drop on supply lines.
- Use connecting elements (such as connectors or terminal boxes) with metal housings. Only the signals and power supply of the connected encoder may be routed through these elements. Applications in which additional signals are sent through the connecting element require specific measures regarding electrical safety and EMC.
- Connect the housings of the encoder, connecting elements and subsequent electronics through the shield of the cable. Ensure that the shield has complete contact over the entire surface (360°).

For encoders with more than one electrical connection, refer to the documentation for the respective product.

- For cables with multiple shields, the inner shields must be routed separately from the outer shield. Connect the inner shield to 0 V of the subsequent electronics. Do not connect the inner shields with the outer shield, neither in the encoder nor in the cable.
- Connect the shield to protective ground as per the mounting instructions.
- Prevent contact of the shield (e.g. connector housing) with other metal surfaces. Pay attention to this when installing cables.
- Do not install signal cables in the direct vicinity of interference sources (inductive consumers such as contacts, motors, frequency inverters, solenoids, etc.).
 - Sufficient decoupling from interference-signal-conducting cables can usually be achieved by an air clearance of 100 mm or, when cables are in metal ducts, by a grounded partition.
 - A minimum spacing of 200 mm to inductors in switch-mode power supplies is required.
- If compensating currents are to be expected within the overall system, a separate equipotential bonding conductor must be provided. The shield does not have the function of an equipotential bonding conductor.
- Only provide power from PELV systems (**EN 50178**) to position encoders. Provide high-frequency grounding with low impedance (**EN 60204-1 Chap. EMC**).
- For encoders with 11 µApp interface: For extension cables, use only HEIDENHAIN cable ID 244955-01. Overall length: max. 30 m.

Minimum distance from sources of interference

Sales and Service

More Information

Other devices for angular measurement from HEIDENHAIN include rotary encoders, which are used primarily on electrical motors, for elevator control and for potentially explosive atmospheres.

Angle encoders from HEIDENHAIN serve for high-accuracy position acquisition of angular movements.
