**GENERAL INFORMATION**

**Lafert Group product policy**

In the next few pages we offer a detailed overview of our manufacturing programme of AC induction motors.

The main scope of our core business is the development of dedicated solutions that improves our Customer's product design, thereby giving our customers a competitive advantage. The core business of our Company stands on the ability to adapt and engineer our standard Product design to any specific market demand.

Lafert's range of products is divided in four product sectors:

**ENERGY EFFICIENT Motors**, standard high efficiency motors, in the range 56 to 315

**CUSTOMISED Motors**, special and customised motors, brake motors and single-phase motors

**HIGH PERFORMANCE Motors**, high performance, permanent magnet motors and generators as well as the relevant drives.

**SERVO Motors & Drives**, brushless servomotors and drives for industrial automation

**LIFT Motors**, synchronous gearless machines with permanent magnet rotor for elevators

**ENERGY EFFICIENT Motors****CUSTOMISED Motors****HIGH PERFORMANCE Motors****SERVO Motors & Drives****LIFT Motors**

## SERVO MOTORS & DRIVES

### Brushless Servo Motors

Among the few independent manufacturers of Servo Motors in the market, Lafert can supply a wide range of standard and tailor made products for Industrial Automation.

The whole manufacturing process is integrated within Lafert manufacturing facilities, giving an excellent flexibility to specific market demands, as well as a high level of cost-efficiency.

- Brushless Standard Motors
- Direct Drive Motors
- Low Inertia Motors
- Compact Motors

*A separate catalogue is available.*

### Servo Drives

Our products are manufactured according to the criterion of adaptability and flexibility. This ensures an easy and fast set-up, by means of the most advanced hardware and software technologies.

Every device always ensures the highest reliability and safety, because it is subject to strict tests in different load and climatic conditions.

*A separate catalogue is available.*

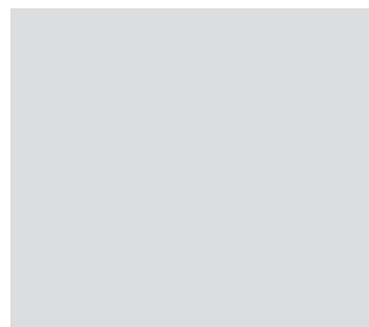

**HIGH PERFORMANCE MOTORS****High Performance Motors with permanent magnet rotor**

A differentiator with Sensorless Permanent Magnet Motors is the absolute high efficiency level and the compact design. The efficiency level normally stands over 90% all along the motor's speed range.

This Product must be driven by a frequency converter, that can also be on-board as an integral drive.

Major applications are the Pump and Fan Industry, Textile Machinery Manufacturers, Gearbox Manufacturers, Traction Systems for microcars and scooters; this Product can be produced as a Generator for Wind Energy.

## LIFT MOTORS

### Gearless Machines for Elevators

The SHIRE range allows the manufacturing of systems where the traction machine is inside the elevator shaft, so there is no need for a machine room, with obvious space and cost savings and a more rational layout of the all components.

SHIRE is permanent-magnet gearless synchronous machine with torque up to 660 Nm for systems up to 1,275 kg.

The compact and heavy-duty motor comes with the following features:

- Very small dimensions
- High Efficiency
- High comfort
- No maintenance
- Low noise level

**ENERGY EFFICIENT MOTORS****High Efficiency Three-phase Motors**

The standard design includes the following basic features to give a high level of flexibility:

- Multi Mount Construction for an easy change of terminal box position
- Terminal box rotates by 90° to allow cable entry from any direction
- Easy-to-change flanges with over-sized and smaller-sized dimensions
- Provision for oil seal at Drive End

Motors conforming to the higher efficiency standards for Europe, North America and Australia.

**IE2**

For Europe, Lafert offers its 'AMHE' range of AC induction motors, whose efficiency values are conforming to IE2 requirements.

Lafert's motor for the North American market comprise the 'AMH' range. These machines meet the higher efficiency demands of the USA's Department of Energy's Energy Policy Act (EPAAct): it is illegal to import Motors into the USA and Canada that do not comply with this standard.

In addition to EPAAct requirements, these motors are a recognised component verified by Underwriters Laboratories and carry the UL approved logo.

## CUSTOMISED MOTORS

### Dedicated and customised executions

Lafert specialises in customised solutions for non-standard motor applications. We are considered as a market leader in this field and have built a reputation for excellence for this core activity over the past 45 years.

The range of specials includes both electrical and mechanical variants:

- Extended stainless steel motor shafts for the fan industry
- Motors for pumping applications
- Complete Tailor made designs
- Customised flange and shaft for gear motors
- Electrical design to meet specific duty requests
- Specific wound motors for worldwide electrical supply
- Motor design to meet special environmental requests (Smoke and heat exhaust ventilation, Dust Ignition for Zone 22, Non Sparking Exn)

### Brake Motors

Lafert's brake motors (3 and single phase) are engineered to give safety, versatility and long service life. The motor's mechanical design is specific for brake motors in order to avoid any risk of failure.

The three brake options available can fit any application and are available both with AC or DC brake coil.

The AMBY and AMBZ ranges have a very strong design and may meet any heavy duty application. The AMBY range is also available with low noise brake, specific for theatres. The compact AMS range is the ideal solution for woodworking equipment manufacturers, packaging machines manufacturers, as well as small crane manufacturers.

As well as meeting industry specific safety requirements, the motors are also failsafe machines: a combination that ensures maximum machine safety.

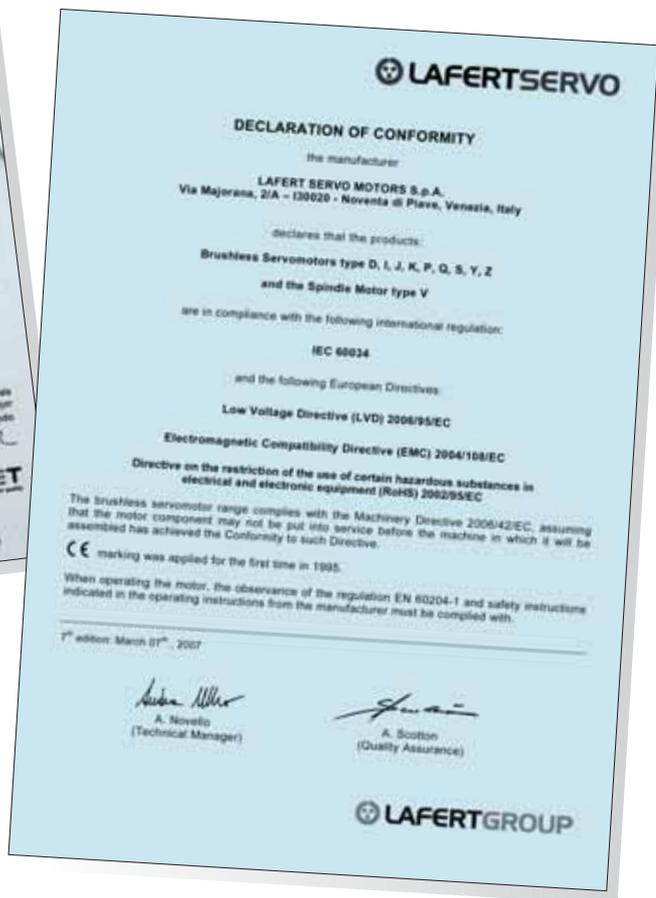

**Our Strengths:** Customer Designs  
Exact Engineering

*...In Partnership with the Customer*

## STANDARDS AND REGULATIONS

The strictness of our quality control assures the flawless operation and reliability of our products. Our quality system is certified to ISO 9001 by CERMET, the certifying body of SINCERT.

Furthermore all servomotors are manufacturable according to the following standard:

**UL 1004 - Electric Motors**  
and **CSA C22.2 No 100 - Motors and Generators**

So the mark  applies to the whole series.

### Derating according to ambient temperature

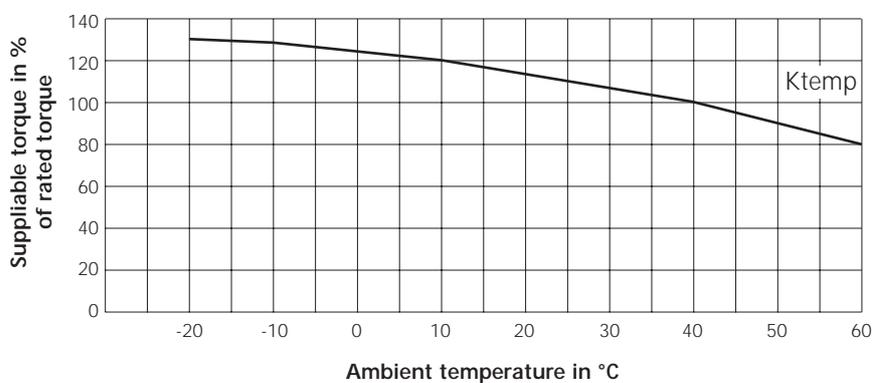

Fig. 2

### Suppliable torque according to a duty cycle

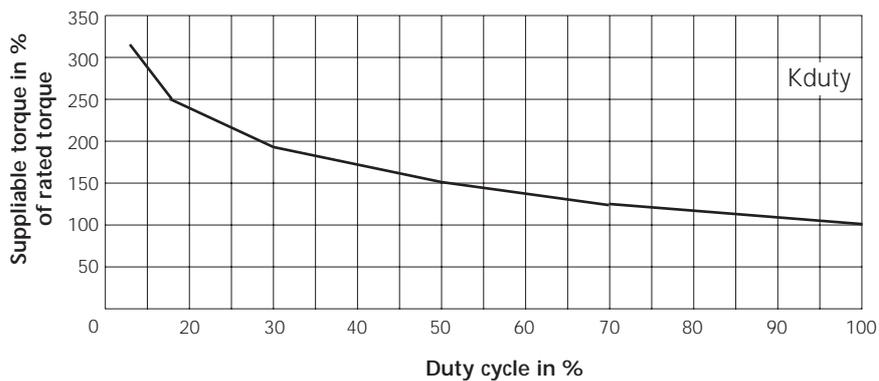

Fig. 3

The permanent magnet synchronous servomotor along with the relative electronic drive, represents a servo system suitable for driving a shaft at high performance, particularly when dynamic control during transients or steady state stability is required. In general, they assure higher bandwidths than other motor types due to their compact design giving a high ratio of torque/inertia. They need no brushes, as their name suggests, unlike a DC motor. This gives high performance for limited dimensions, excellent reliability and reduced maintenance procedures.

Brushless servomotors are used in a wide range of operating fields, chosen for their ability to operate with an almost constant torque and withstanding overloads several times higher than rated current.

Servomotor performance is linked to the electronic drive that supplies them controlling stator phase switching thus substituting the commutator of the old DC machines. In the brushless servomotor currents are distributed to windings through power static switches (for example, IGBT, MOSFET) according to the position detected by means of an angular position transducer, such as resolver, encoder or Hall sensor. The power bridge along with the feedback element replaces the commutator of the old DC machines. The feature maintained in common with a DC motor is constant torque up to rated speed.

Three-phase synchronous permanent magnet servomotors are made up of the following main components:

- Stator, with low-loss Fe-Si core lamination stack and three-phase star connection winding; insulation class F (for temperature rise of  $\Delta T=105^{\circ}\text{K}$  and ambient temperature of  $+40^{\circ}\text{C}$ ). Optionally available cURus compliant insulation system.
- Rotor, characterized by low-loss Fe-Si core lamination stack and peripheral surface with rare earth permanent magnets; the shaft is made of Ni-Cr steel; bearing have permanent lubrication.
- Frame components, such as die-cast flange, endshield and cover, and extruded aluminium case.
- Rotor position detector, whose adjustment responds to specific rules.

is available in different types:

- Phase control and monitoring of motor revolution speed with a Resolver, (2-pole standard version, available with 4 and 6 poles) combinable with other feedback options.
- Monitoring of angular position and motor rotation speed with an Encoder combinable with other feedback options.

Note: it is also available with a sinusoidal encoder and a RS485 interface.

- AC (standard) brushless tachogenerator for monitoring motor rotation speed, equipped with three-phase winding (table "Tachometric transducer") combinable with other feedback options.
- Hall-effect sensors with high thermal stability and high magnetic sensitivity: They allow monitoring of the rotor position for the correct piloting of the power bridge combinable with other feedback options.
- Thermal sensor placed into stator winding in order to protect motor temperature. Different sensors type is also available on request.
- Connections with the drive for both power and signals with connectors in all series.
- Terminal board as an alternative option, instead of the power connector with brass-plated bolts. Easy access to connections and high operating safety (except for B28, B36 available only with connectors).
- Failsafe holding brake (optional) to be fitted in the flanged endshield, equipped with permanent magnets and electromagnetic release.

### **Brief Description**

The following features of our standard motors may vary depending on series and type:

- Admissible environmental temperature: from -15 °C up to +40 °C, with altitudes 1000 m above sea level
- Mounting: IM B5 (V1 and V3 available)
- Flange concentricity degree "N"; balancing: vibration "N"; dynamic balancing with half key
- Shaft designed according to the standard version with key (also available without key)
- Available stall torque: from 0.15 Nm up to 75 Nm
- Available speeds: 1200, 2000, 3000, 4000, 6000 rpm
- Drive operating voltage: 230 or 400 Vac
- Pole number according to the series: 4, 6, 8, 10 poles
- Insulation class: "F"; cooling through radiation and natural convection
- IP65 degree of protection for the whole range (IP67 optional); B28 is designed with IP65 protection as well except for the flange end
- On-Off PTO switch for thermal protection tripping at 140 °C (NTC and PTC are available)
- Optional feedback by choice: resolver, encoder, tacho and Hall sensors (several combinations may be added to this list)
- High acceleration and deceleration: up to 90.000 rad/sec<sup>2</sup>
- Reduced dimensions
- Rare earth permanent magnets
- Excellent distribution of the rotor magnetic field, in order to eliminate torque fluctuations at low speed.

### **Applications**

- Numerical control shaft drive
- Intermittent motion controls
- Controls according to complex motion laws
- Machine tools for metals, wood and other material manufacturing (in general, chip forming machining)
- Textile machines
- Graphic and serigraphic machines
- Machines for ceramics industry
- Machines for packing industry
- Plastic moulding machines
- Winding and unwinding machines
- Vehicles supplied by batteries for material transport and movement
- Press supply
- Robotics and manipulation
- Transfer lines
- Paper factories

## Definitions - Timing and Motor Identification

### Definitions

- **Stall torque (Mo):** Torque available on the shaft continuously (service S1) with speed close to zero (lower than 200 rpm) and with a winding current equivalent to the stall current (see Figure 4).
- **Rated torque (Mn):** Torque available on the shaft continuously (service S1) with rated speed, and with a winding current equivalent to the rated current (see Figure 4).
- **Peak torque (Mpk):** Torque available on the shaft discontinuously, with a winding current equivalent to the peak current (see Figure 4).
- **Stall current (Io):** Current supplied to the motor continuously at a speed closed to zero, required to develop stall torque.
- **Rated current (In):** Current supplied to the motor continuously at a rated speed, required to develop rated torque.
- **Peak current (Ipk):** Current supplied to the motor discontinuously within a wide range of speed, required to develop peak torque (not to be exceeded to avoid magnet demagnetization).
- **Voltage constant (Ke):** Ratio between voltage induced by the rotor rotation (RMS value for sinusoidal motor, peak value for trapezoidal motor) at a certain number of revolutions and angular speed ( $\omega = 2 \times \pi \times n / 60$  where n is the speed expressed in rpm) measured in rad/sec.
- **Torque constant (Kt):** Ratio between torque on the shaft and the current RMS value for sinusoidal motors, peak value for trapezoidal motors (equivalent to the voltage constant of a trapezoidal motor and to that of a sinusoidal motor multiplied by  $\sqrt{3}$ ).
- **Back electromotive force (B.E.M.F):** Voltage induced by the rotor rotation (RMS value for sinusoidal motor, peak value for trapezoidal motor) at a certain number of revolutions.
- **Phasing procedure:** Synchronization procedure of those signals generated by the transducer with the back electromotive force induced by the rotating rotor and measured between two phase terminals of the motor winding.
- **Saturation (saturation curve):** It is made up of the peak torque curve combined with that representing the physical limit of the current, which may be expressed at some speed according to supply voltage (see Figure 4).
- **Duty cycle:** In case of an intermittent duty cycle it is possible to overload the motor in proportion to the ratio between operating time and total cycle time: the figure shows two overload curves at 20% and 50% (S3 duty).

Torque to speed performance curve: continuous and intermittent duties.

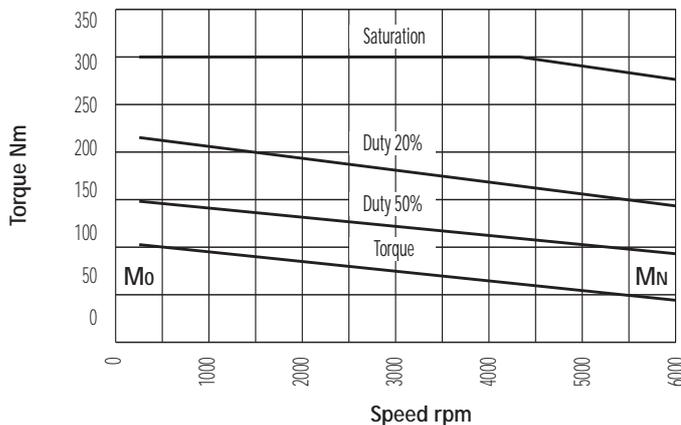

Fig. 4

- **Continuous duty area:** It includes all points of the torque/speed figure where the load torque value is lower than or equivalent to the torque curve that joints Mo and Mn: therefore, this is a continuous operation duty. The continuous duty area is defined as the area below the torque curve in the motor speed range available (see Figure 4).
- **Intermittent duty area:** It includes all points of the torque/speed figure where the load torque value is higher than the torque curve that joints Mo and Mn: therefore, this is non-continuous operation duty. The Intermittent duty area is defined as the area between the torque curve and the saturation curve (see Figure 4).

### Phasing Procedure

- **Autotuning**

In the event that the motor is equipped with a new generation digital drive you only need to carry out phasing procedures explained in the reference handbook, thus matching data indicated in the motor nameplate with related parameters.

- **Example of mechanical manual phasing procedure of a 2-pole resolver mounted on a 6-pole sinusoidal brushless servomotor.**

Disconnect terminals U, V, W from the DRIVE.

Inject a direct current applying voltage with positive polarity in the phase V (blue) and negative polarity in the phase W (red): in this way the rotor of the motor results locked in a certain position. A current is required to hold the rotor in a fixed position, therefore without the presence of position clearance. The resolver must be excited with an operating generator at 7VRMS - 10KHz or through a drive, keeping, for instance, only electric supply R1, R3 connected to the drive and leaving the other wires (S1, S2, S3, S4) free. Display the signal S1 (red) and S2 (yellow) using a two-channel oscilloscope by connecting each probe screen to the equipotential connections Mo, including wires S3, S4 and R3 (see Resolver at page 27). Loosen the clamp screws of the NDE-shield and turn the stator of the resolver (always keeping the motor shaft still) until the signal S1-Mo is null (=100mV) and the signal S2-Mo reaches the maximum value. Check that, slightly turning the motor shaft clockwise (looking at the flange end and disconnecting S2 probe in order to connect the power supply voltage signal R1), the signal S1-Mo results in phase with the signal R1-Mo. In the event that it is in phase opposition (180°), turn the resolver again and search for the following position that minimizes the signal S1-Mo, and then repeat the phase test. As soon as a reciprocal phase is obtained, let the shaft free to reach the angular position (V-W phases are still executed by the direct current). In this position fix the stator of the resolver with the screws that must be sealed using varnish.

### Motor Identification

In order to properly choose the motor, kinematic mechanism must be assessed, thus defining rated and stall torque, accelerations required through a speed torque graph compared with time, inertia of the machine (when a gearbox is coupled to the motor), and installation environment.

In order to make the choice of the motor easier, please refer to the Chapter "Order Data".

### Degrees of protection

Degrees of protection for mechanical machines are designated in accordance with IEC 60034-5 by the letters **IP** and two characteristic numerals.

First numeral: Protection against contact and ingress of foreign bodies

Second numeral: Protection against ingress of water

IP	Description
0	No special protection
1	Protection against solid foreign bodies larger than 50 mm (Example: inadvertent contact with the hand)
2	Protection against solid foreign bodies larger than 12 mm (Example: inadvertent contact with the fingers)
3	Protection against solid foreign bodies larger than 2.5 mm (Example: Wires, tools)
4	Protection against solid foreign bodies larger than 1 mm (Example: Wires, bands)
5	Protection against dust (harmful deposits of dust)
6	Complete protection against dust. Is not described for electrical machines to IEC 34-5

IP	Description
0	No special protection
1	Protection against vertically falling water drops (condensation)
2	Protection against dropping water when inclined by up to 15°
3	Protection against waterspray at up to 60° from vertical
4	Protection against water splashed from any direction
5	Protection against water projected by a nozzle from any direction
6	Protection against heavy seas or water projected in powerful jets
7	Protection when submerged between 0.15 and 1 m.
8	Protection when continuously submerged in water at conditions agreed between the manufacturer and the user

*Series B28 are manufactured with degree of protection IP65 except for flange end. while series B36, B56, B63, B71, B100 are fully designed in accordance with degree of protection IP65. In addition, IP67 motors can be designed on request.*

Tab. 1

### Bearing Mounting

Type	DE-shield bearings	NDE-shield bearings	Preloading bearing
All type	Locating bearings	Non-locating bearings	Non-drive end

Tab. 2

### Bearing lubrication and maintenance

All motors have bearings type 2ZC3 with grease suitable for high and low temperature and permanent lubrication.

Grease type WT (asonic GHY 72) or LHT 23 (multemp) or ENS: suitable for low and high temperature (-40; 140 °C)

### Paint Finish

Motors are marketed with two different paint finishes:

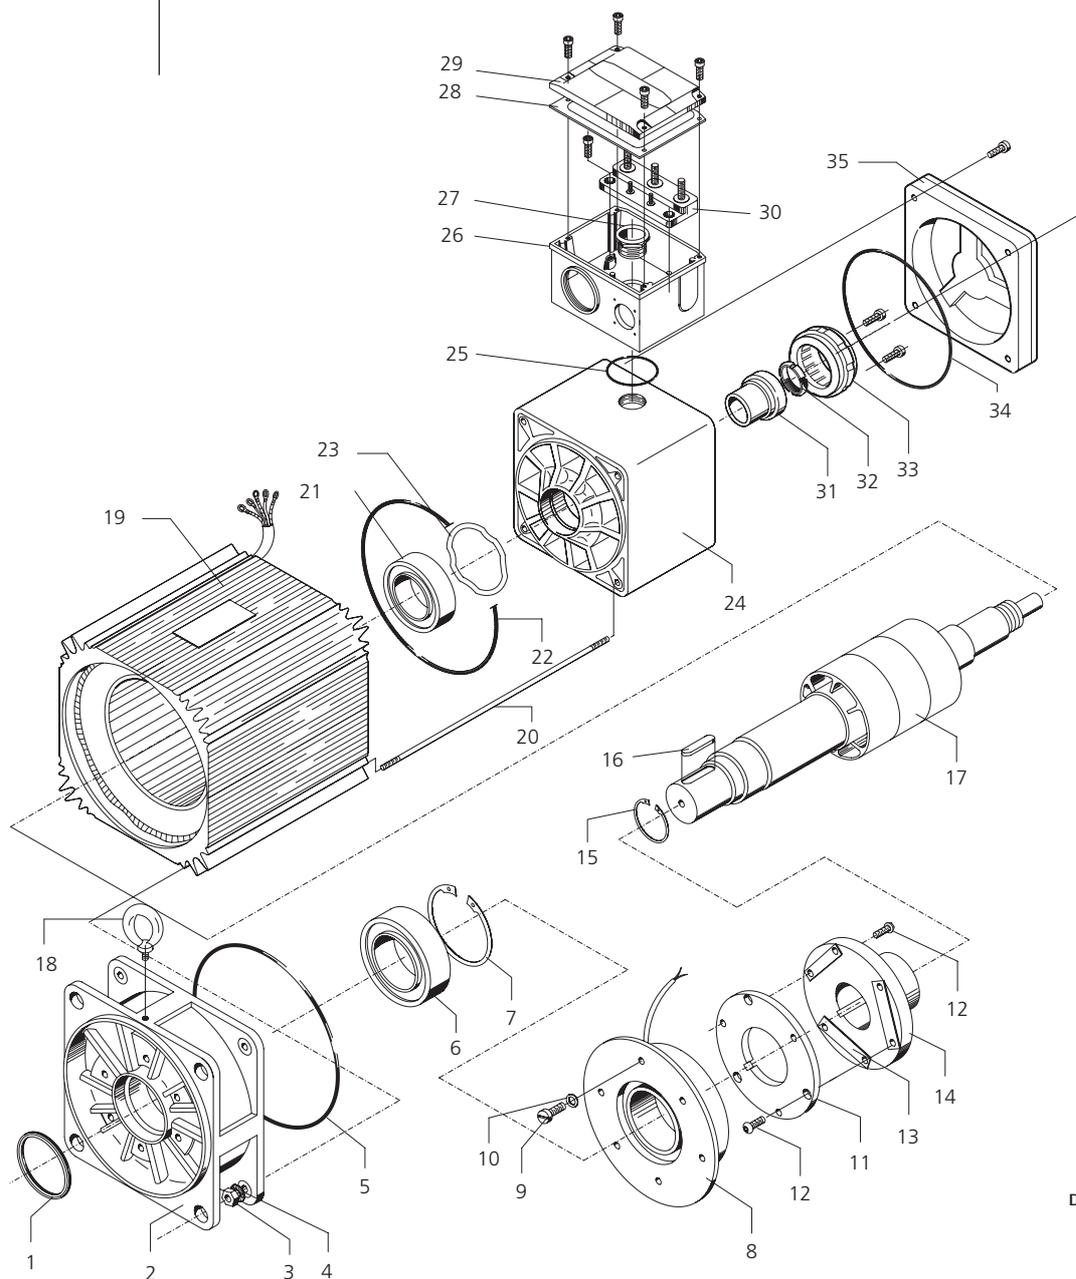

- *Normal finish*: Black finish with mono-component water-soluble enamel, suitable for applications in environments not exposed to climatic agents.
- *Special finish*: Dull black finish with bi-component polyurethane, suitable even for environments partially exposed to climatic agents.

## Features of feedback detectors

As previously indicated, motors may be equipped with various transducer types in order to meet the different requirements for precision, cost and other parameters. The standard motor includes the use of resolvers. Encoders, tachos and Hall sensors are also available.

Example for the definition of the option required:

B 71 12 I 3 H 1 A 05 0 000

### Trasducer

00 = No transducer	
X5 = Resolver*	X9 = Hall sensors + Encoder*
RS = Encoder Stegmann SRS	RM = Encoder Stegmann SRM

\* See type description on page 37

Tab. 4

### Resolver

Rated features	Assembled on the whole series	Units of measurement
Supply voltage	7 ( $\pm 5\%$ ) 10 kHz	Vrms
Maximum speed	10000	rpm
Input current	50	mA
Pole number	2/4	/
Transformation ratio	0.5 $\pm 5\%$	/
Electric error	$\pm 8'$	°(Elect)

Tab. 5

## Incremental Encoder + Hall sensors

Rated features	Assembled on the whole series	Units of measurement
Supply voltage	5 ( $\pm 5\%$ )	Vcc
Impulse number per revolution	1024 <sup>1)</sup>	ppr
Pole number	6 <sup>2)</sup>	/
Maximum frequency	100	KHz
Permitted maximum current	150	mA
Maximum speed	6000	rpm
Encoder electronics	Line driver <sup>3)</sup>	/
Hall electronics	NPN open collector <sup>3)</sup>	/

<sup>1)</sup> Available 1000 (opt. E9), 1024 (opt. 09), 1500 (opt. I9), 2000 (opt. L9), 2048 (opt. F9), 4000 (opt. G9), 4096 (opt. H9)

<sup>2)</sup> 4, 8 and 10 poles available

<sup>3)</sup> Further types of electronics available

Tab. 6

## Electrical Components

### Thermal Protection

All our motors are equipped with a single PTO switch, a thermal on-off detector that activates itself at a temperature of 140 °C (standard tolerance 5 °C). However a NTC or a PTC may be used as an alternative.

### Parking Brake

Motors with option "B" (in the alphanumeric code it is the 10th position as from the left: "A" and "D" no brake, "B" and "E" brake), are equipped with a parking brake with features depending on the series. See specific table for each motor type.

### Forced Ventilation

All standard motors are not ventilated; they are therefore cooled by conduction and convection through the surface (system IC410 or IC416).

In the series from B63 through to B100, forced ventilation motors are also available. In this way it is possible to increase torque and current rated values by 25%. Length dimensions increase as well to accommodate the cooling fan (reference data is indicated in the table below).

All fans have a degree of protection equal to IP20 (max IP54).

Fan characteristics are depending on motor sized according the table below:

Type	Voltage Volt	Frequency	Poles Hz
B63J/B63Q	2-230/24DC	50/60	2
B71Q	2-230/24DC	50/60	2
B100Y	2-230/24DC	50/60	2

Tab. 7

The standard signal and power connections described below refer to motors equipped with resolver and encoder. The options listed may be customised according to the specific requirements of the customer.

### SIGNAL CONNECTORS

Type	N° Pin	Male connector code	Female connector code	Connector shape

Tab. 11

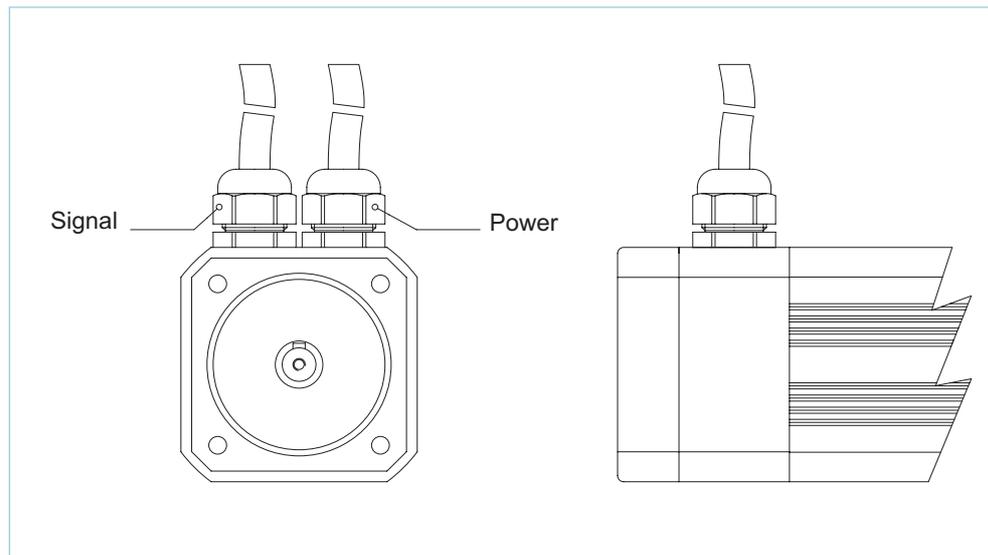

**For all series motors**

Drw. 8

**Connection 5**

Outgoing cables plus strain relief variable according motor size.

**For all series motors**

Drw. 9

**Connections 6 and 7**

Power and signal connectors 90° angled FIXED and ROTATABLE, anchored to the alluminium frame.

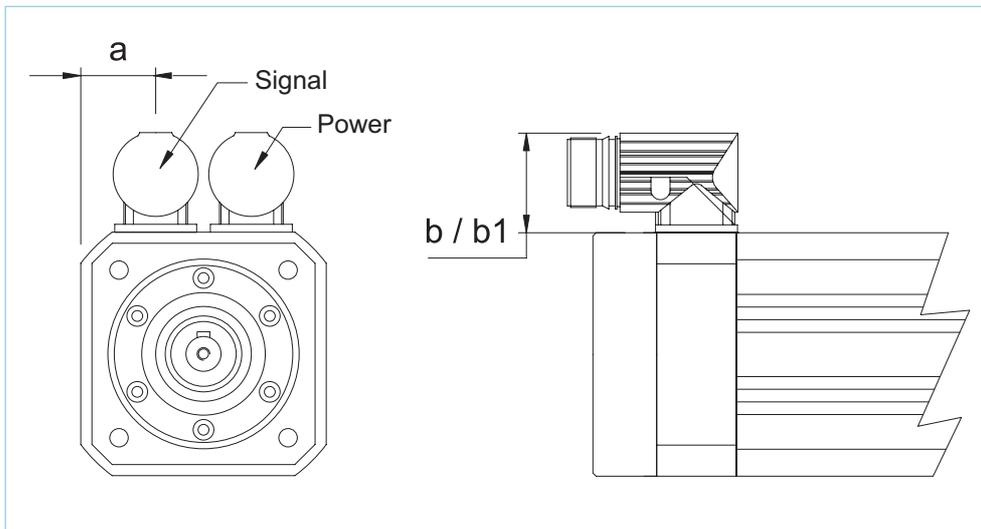

Suitable for all series.

The connector direction can be defined through motor type (see page 34).

Type	B28S	B36I	B56	B63	B71	B100	B132
Distances referred to the connector in (mm)							
<b>a</b>	14	24	32	39	53	73	78
<b>b</b>	37	32	32	32	32	32	56
<b>b<sub>1</sub></b>	45	40	40	40	40	40	62

b<sub>1</sub>: Rotatable connector height referred to connection 7.

Tab. 12

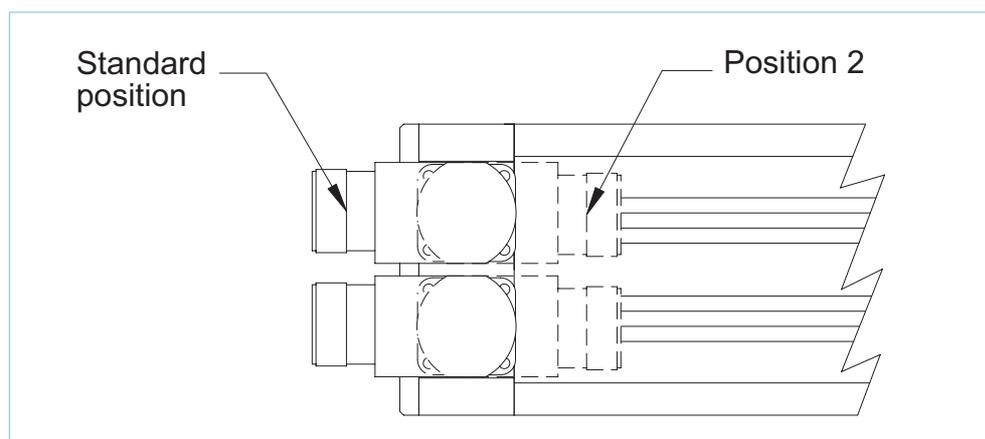

Drw. 10

**Direction of**

## CONNECTORS

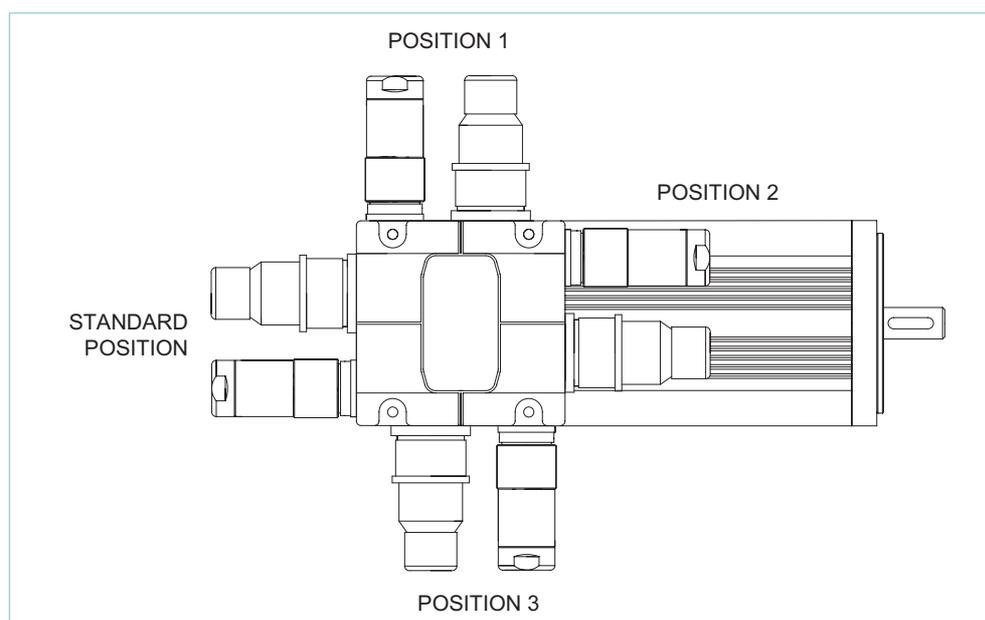

Referable to connection 6 and 7: generally directions "standard" and "2" applies to all motor series manufactured with 90° angled connectors.

Drw. 11

## TERMINAL BOX

Four different mounting positions are available relating to the location of the terminal box and connectors when looking at drive end. "0" is the standard position, "1", "2" and "3" according to the figure below (please also refer to motor coding).

Drw. 12

**Motors for continuous duty S1**

Quotation	No. and date
Quantity	Unit
Name	Type
Stall torque	Nm
Rated speed	min-1
Rated voltage	Volt
Mounting arrangement	Ex - 600034-7
Degree of protection	Ex - 600034-5
Feedback element	Resolver. Encoder. Tacho or Hall sensors
Thermal detectors	PTO (otherwise PTC or NTC)
Parking brake	"Yes" or "No"
Connection from	1 to 7
Possible terminal box	from 0 to 3

**Additional information**

Paint finish	Cold-water or two component paint
Vibration level	Indicate class: "N", "R" or "S" ex - IEC60034-1-14

*The lead time is strongly related to the motor configuration, please contact us about this subject.*

**Additional information for special duties**

S 2: ... min (short-time duty)

S 3: ... % - ... min (intermittent duty)

S 4: ... % - JM ... kgm<sup>2</sup> - Jext ... kgm<sup>2</sup> (intermittent duty with starting)

S 5: ... % - JM ... kgm<sup>2</sup> - Jext ... kgm<sup>2</sup> (intermittent duty with electric braking)

\* The value of inertia is approximate, because it is deeply depending on the type of coupling chosen by the customer.

\*\* The value of stall and nominal torque are approximate and depending on the type of coupling system chosen for the application.
